A close-up photograph of several lavender flower spikes. Two bees are visible: one is perched on a flower on the left, and another is in flight towards the center. The background is a soft-focus field of more lavender plants.

The Economics of Biodiversity:  
The Dasgupta Review

Final Report of the Independent Review  
led by Professor Sir Partha Dasgupta

Commissioned by the Government of UK

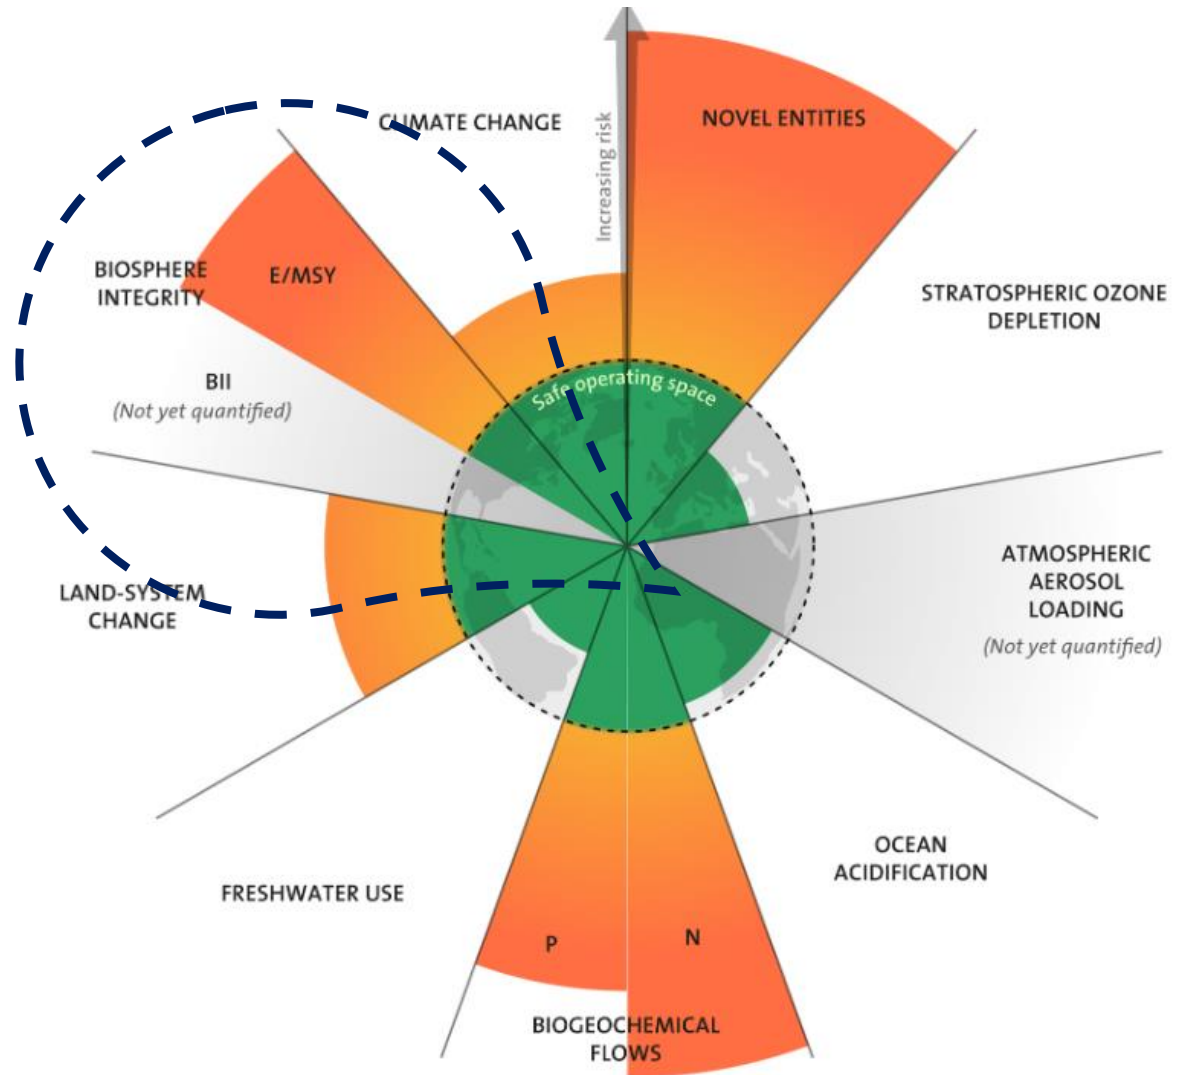

# Biodiversity, a problem child

Planetary Boundaries - Status Quo

Biodiversity...

"refers to the variety of living species on Earth, including plants, animals, bacteria, and fungi."

- National Geographic

Source: Stockholm Resilience Center (2022)

# Conservation of Nature

## Chapter 18

### Biodiversity and Protected Areas...

„are associated with higher wealth, lower poverty, improved health and body size“ (p. 441)

- Between 20% to 40% of terrestrial vertebrates and plants at extinction risk
- 515 species are currently facing extinction (Raven et al., 2020)
- Acceleration expected
  - Due to human pressures and
  - Ecological interactions – “extinction breeds extinction”

# Place-based conservation

Conservation of Nature

Placed-based  
conservation...

"...encompasses Protected Areas  
but also (local) community-led  
efforts seeking to protect  
ecosystems" (p.440)

## Case Study:

### The Coastal Cloud Forest of Loma Alta

Ecuador 

- Protected Areas are typically downsized ("PADDD")
- While enduring terrible management
- Solution: Understanding of ES and established ownership rights

# Species-led conservation

Conservation of Nature

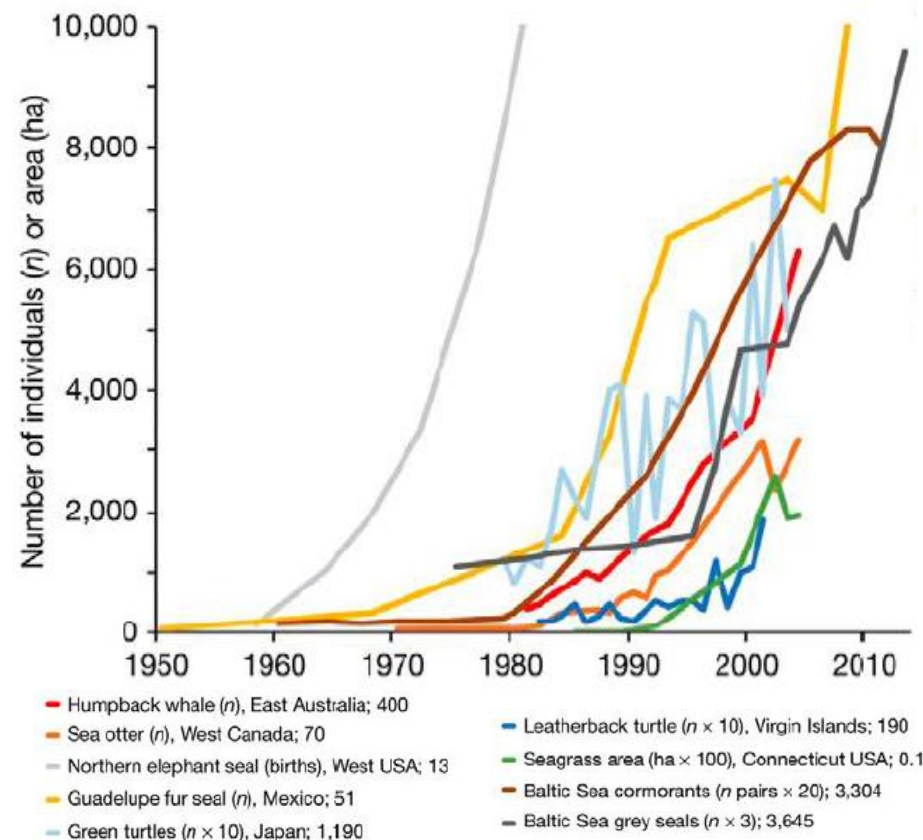

Species-led  
conservation...

"...involves conservation approaches to meet individual species requirements for typically keystone species by regulating wildlife trade or utilizing seed-banks" (p.440)

## Case Study:

### Humpback Whaling Ban 1986

Atlantic and Pacific Ocean 

- Whale population reduced to 440
- Ban was highly effective, full rebound
- CITES Wildlifetrade
- Only 4% to 9% of animals are covered by Protected Areas

# Conservation methods – Pros and Cons

Conservation of Nature

		
Place-based	<p>Job opportunities for locals</p> <p>Allows for indigenous knowledge</p> <ul style="list-style-type: none"><li>• And traditional wisdom</li></ul>	<p>Solid <u>local</u> framework required</p> <ul style="list-style-type: none"><li>• Property rights, peace</li></ul> <p>Difficult supervision</p> <ul style="list-style-type: none"><li>• resulting in poor management</li></ul>
Species-led	<p>Fast and global conservation</p> <ul style="list-style-type: none"><li>• Bans on hunting and wildlife trade can work well (assuming enforcement)</li></ul>	<p>Limited application</p> <ul style="list-style-type: none"><li>• Charismatic animals are preferred, human preference bias</li></ul>

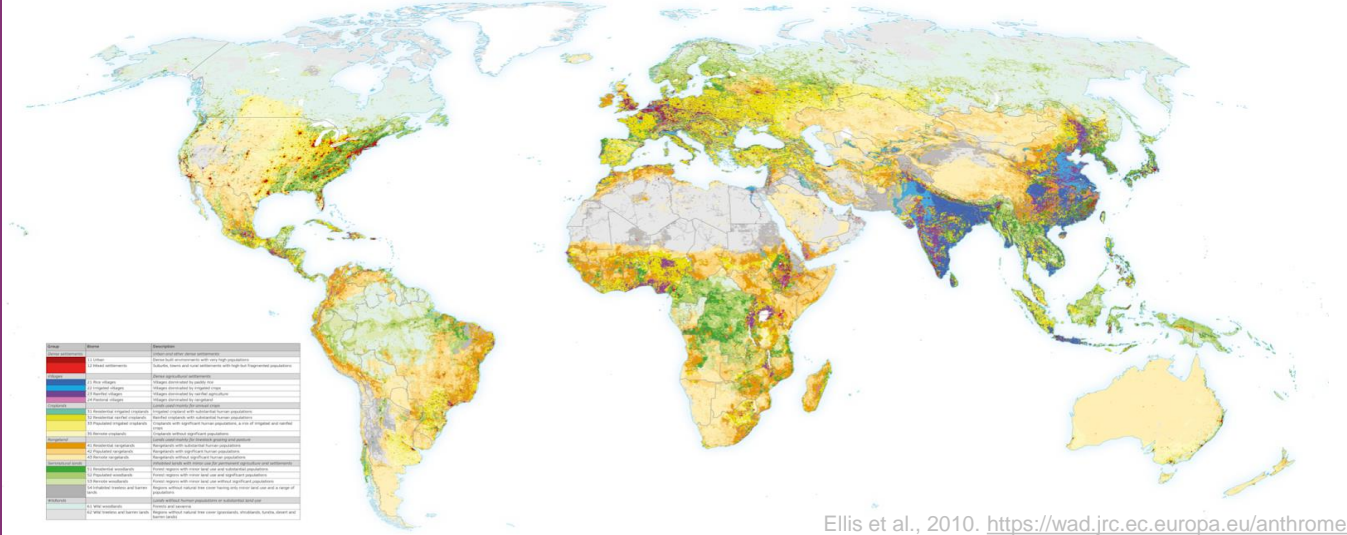

# Restoration of Nature

## Chapter 19

### Anthromes (Anthropogenic biomes)

Terrestrial lands whose ecosystem was altered by human activity

e.g., rice villages, farmland or urban areas

Ellis et al., 2010. <https://wad.jrc.ec.europa.eu/anthromes>

### Control of Invasive Species

### Sustainable Land Management

### Rewilding

### Nature-based solutions

# Rewilding

Restoration of Nature

## Rewilding...

"...seeks to recover natural processes without predetermined targets other than the restoration of functioning ecosystems" (p.454)

### Case study:

## The Oostvaardersplassen

The Netherlands 

### 1970s

- abandoned reclaimed area
- colonized by greylag geese

### 1980s

- Introduced Heck cattle & Konik horses

### 1990s

- Added red deer & fox

### Today

- 6000 ha. Of marshland, wet and dry grasslands
- Over 250 bird species including white-tailed eagle

# Rewilding – Pros and Cons

Restoration of Nature

## Cost-effectiveness

- Less human interventions = less cost

## Richer and more abundant species

- In comparison to active restoration

## Slow progression

- Minimum of 30 years after clear-cutting

## Requires vast area

## Lack of predictability

- Results may include “incomplete” or novel ecosystems

# Nature-based solutions

Case Study 2: Cheonggyecheon River Restoration in Seoul, South Korea 

## Nature-based Solutions...

"...sustainably manage and restore ecosystems while simultaneously providing benefits for human well-being and biodiversity" (p.456)

### Restoration Process

(2003 – 2008)

#### Highway Removal

#### Green & Blue Infrastructure recreation for wildlife

### Current developments

(2003 – today)

#### ✓ Socio-economic Benefits

New recreation space  
Hosting 20m per year  
Revitalization of community

#### ✓ Environmental Benefits

Flood protection  
Carbon reduction  
Heat-island effect  
Pollution reduction  
639% increase in species richness

# Nature-based solutions – Pros and Cons

Restoration of Nature

Simultaneous addressing of social, economic & environmental issues

## Environmental Benefits

- Climate change mitigation
- Pollution reduction
- Biodiversity restoration

## Social Benefits

- Cultural Services
- Local revitalization

## Economic Benefits

- Creation & protection of jobs
- Cost-effectiveness (in comp. to grey infrastructure)

Requires careful planning and good governance

Potential for conflicts, trade-offs and resilience issues in long term

- Less ecosystem services

# Effective Implementation

Bringing Natural Capital into Spatial Planning

## Decision-making support

### InVEST

(Integrated Valuation of Ecosystem Services & Tradeoffs)

### ROOT

(Restoration Opportunities Optimization Tool)

- Assess trade-offs & ecosystem services
- Identify optimal area to invest in NC

## Mitigate impacts

### Biodiversity offsets

Compensate for negative impacts of projects

### Habitat Banking

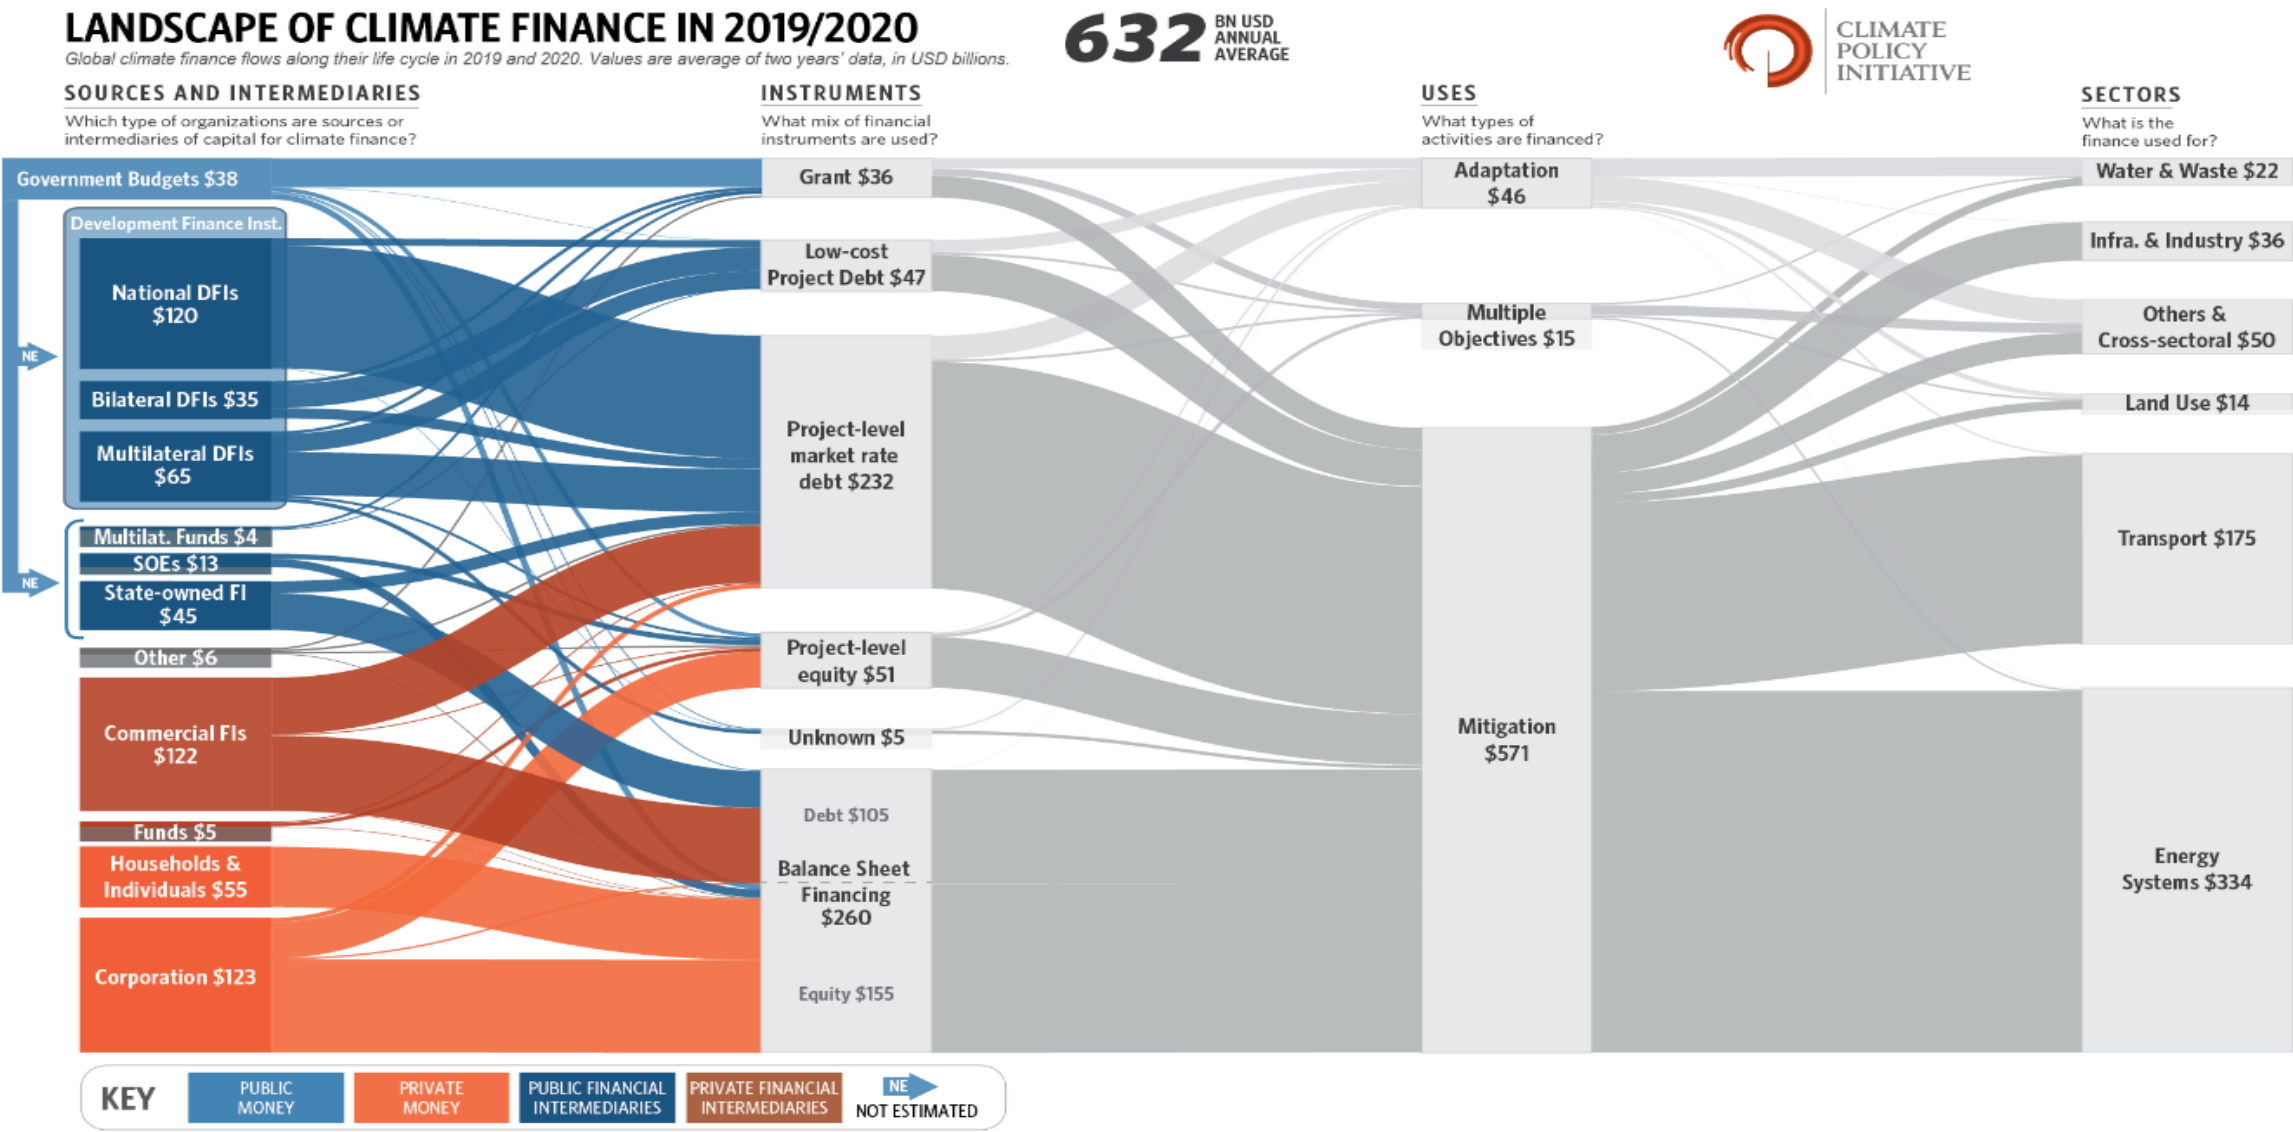

Trading „biodiversity credits“

- Mitigate the impact of development
- Potential gain in biodiversity

- Balance Economic, Social and Environmental trade-offs
- Provide long-term framework for stakeholders
- Opportunities to conserve & restore Nature

# Finance for Nature

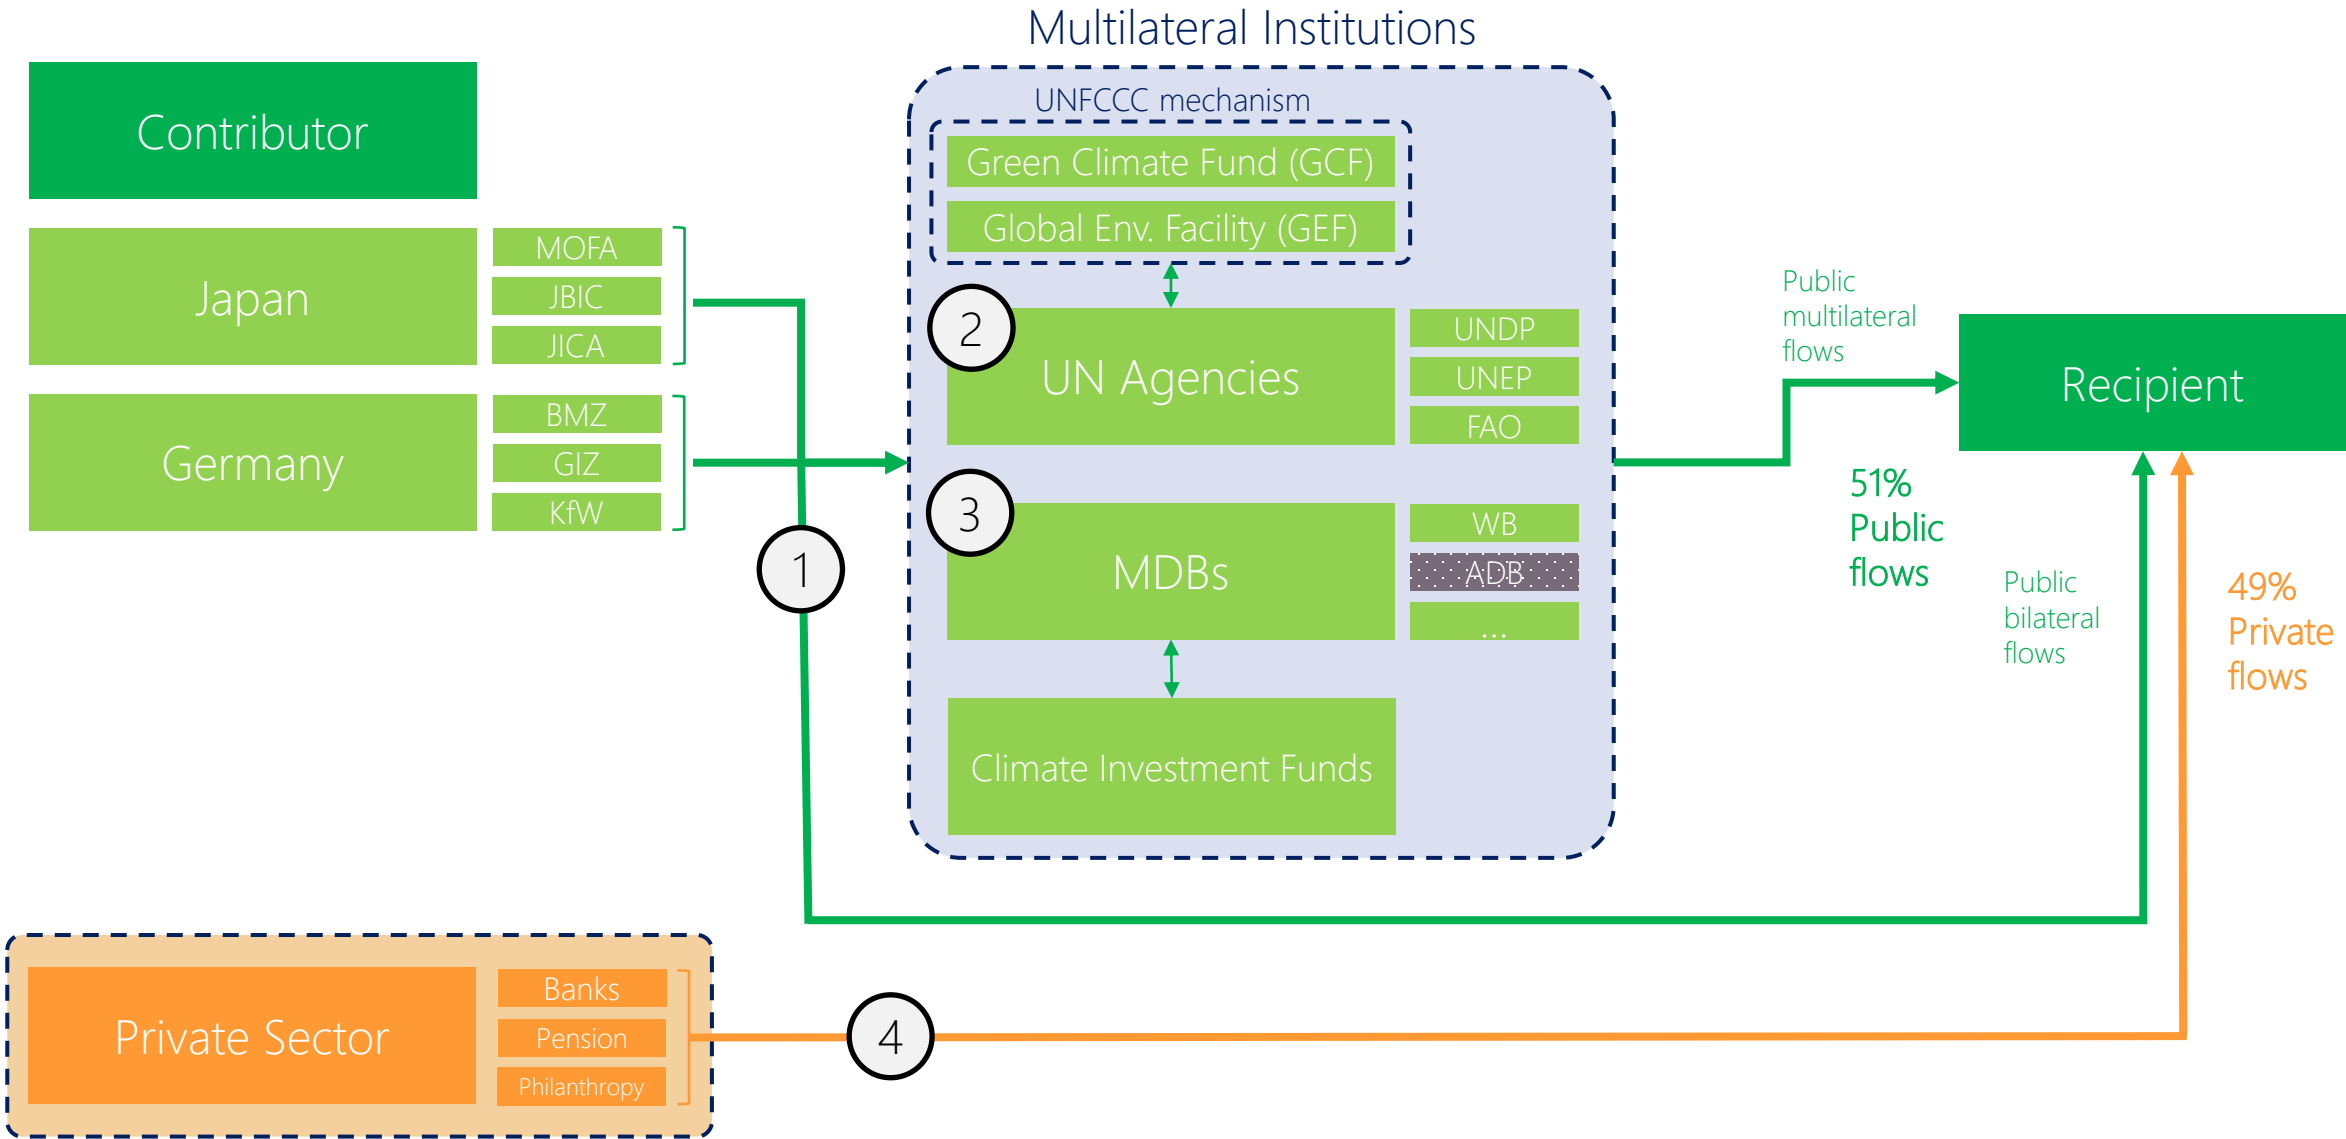

## Chapter 20

# Climate Finance Architecture

Finance for Nature

# Climate Finance Architecture

Finance for Nature

Multilateral Institutions

Contributors

Japan

Germany

**Aggregate Net Financial Flows to Low- and Middle-Income Countries**  
1980 to 2020, in Billion USD

Source: Own representation, based on WBs International Debt Statistics,  
"1980-1989" refers to the average value across the timeframe

Why are Private Flows so small?

- 1) High-risk
- 2) Difficult investment climate
- 3) Data scarcity
- 4) Absence of Standards

49%  
Private  
flows

Private Sector

Banks

Pension

Philanthropy

4

# Blended Finance

Financing of Nature

## Blended Finance...

"... attracts commercial capital towards projects that contribute to sustainable development, while providing financial returns to investors." (OECD)

Case study:

 **EcoEnterprises Fund for Biodiversity**  
Colombia 

### Blended Finance

- Pre-Invest technical assistance
- Involvements of DFIs

### Venture Capital technique

- Collaborative, stage-based approach

### Portfolio aggregation and management

- Regular monitoring, project diversification

- 2000 ha. Lime plantation with employees
- Preserving ecosystem and food chain
- Grant-based savings accounts to fill cashflow gaps

# Conclusion

- Community Engagement and ES comprehension is key
- Combining place- and species conservation for success
- The right restoration approach depends on the context
- Governance and careful planning are the foundation for good restoration projects
- The Biodiversity business case needs to be developed – Blended Finance as a great tool

Thank you for your Attention!  
Any Questions?
